## BOOK SYNOPSIS

Chronic compartment syndrome of the anterior thigh is extremely difficult to diagnose based on symptoms. Primary symptoms are commonly misdiagnosed as iliotibial band syndrome, and treated conservatively. The purpose of this case study is to aid in educating sports medicine personnel to better evaluate and properly treat possible compartment syndrome of the anterior thigh by presenting a unique case in a collegiate female tennis player. The student athlete underwent surgical fasciotomy and six months of physical therapy before returning to tennis activities. Practitioners should be aware of chronic compartment syndrome as a possible cause of anterior thigh pain.
